The Dirichlet problem and boundary regularity for nonlinear parabolic equations

Jana Björn

Linköping University, Sweden

The p -parabolic equation $\partial_t u = \Delta_p u := \operatorname{div}(|\nabla u|^{p-2} \nabla u)$ is a nonlinear cousin of the classical heat equation. As such, it offers both difficulties and advantages compared with the heat equation. In the talk, we consider the Perron method for solving the Dirichlet problem for the p -parabolic equation in general bounded domains in \mathbf{R}^{n+1} . Compared to space-time cylinders, such domains allow the space domain to change in time.

Of particular interest will be boundary regularity for such domains, i.e. whether solutions attain their continuous boundary data in a continuous way. Relations between regular boundary points and barriers will be discussed, as well as some peculiar examples and surprising phenomena related to boundary regularity.

The talk is based on some recent results with Anders Björn and Ugo Gianazza.
